#### Detailed Description of the Invention

10

The compounds of the formula I of the present invention may be prepared according to the following general synthetic schemes, as well as relevant published literature procedures that are used by one skilled in the art. Exemplary reagents and procedures for these reactions appear hereinafter and in the working Examples. Protection and deprotection in the Schemes below may be carried out by procedures generally known in the art (see, for example, Greene, T. W. and Wuts, P. G. M., Protecting Groups in Organic Synthesis, 3<sup>rd</sup> Edition, 1999 [Wiley]).

The synthesis of some key intermediates required for the synthesis of the compounds in this patent are described in Scheme 1. An alcohol 1 ( $R^5(CH_2)_x^2OH$ ) (which preferably is 2-phenyl-5-methyl-oxazole-4-ethanol) is coupled with a hydroxy aryl- or heteroaryl-aldehyde 2 under standard Mitsunobu reaction conditions (e.g. Mitsunobu, O., *Synthesis*, **1981**, 1) to furnish the key intermediate aldehyde 3. Alternatively, the alcohol 1 can be converted to its methanesulfonate ester 4 under standard conditions; the mesylate 4 can then be used to alkylate the hydroxy aryl- or heteroaryl- aldehyde 2 to furnish the aldehyde 3.

A synthesis of the pyrrolidine acids I is shown in Scheme 2. Treatment of the aldehyde 3 with the Horner-Emmons reagent  $(CF_3CH_2O)_2P(O)CH_2CO_2CH_3$  5 (W. C. Still et

al., *Tetrahedron Lett.* **1985**, 24, 4405-5508) provides the Z-alkenyl ester 6. This Z-alkenyl ester 6 is then reacted with N-trimethylsilylmethyl N-methoxymethyl benzylamine 7 under standard literature conditions (e.g. J. S. Carey, *J. Org. Chem.*, **2001**, 66, 2526-2529) to give the corresponding N-benzyl pyrrolidine-ester 8. Deprotection of the N-benzyl group (hydrogenation) gives the key intermediate, pyrrolidine-ester 9. Reaction of pyrrolidine 9 with chloroformate 10

10  $(R^6O-\overset{\overset{O}{\parallel}}{C}-Cl \text{ where } R^6 \text{ is any of the } R^3 \text{ groups except H})$  provides the pyrrolidine-carbamate ester 11. Deprotection of the ester 11 then furnishes the cis-substituted pyrrolidine-carbamate acids I of the invention.

Scheme 3 shows the synthesis of other analogs from the key intermediate pyrrolidine-ester 9. Palladium-mediated reaction of 9 with aryl or heteroaryl bromides (e.g. method of Buchwald et. al., *J. Am. Chem. Soc.*, **2001**, 123, 7727) furnishes the N-aryl or N-heteroaryl pyrrolidine acids II of the invention. Reductive amination of 9 (e.g. the procedure of Abdel-Magid et al, *J. Org. Chem.* **1996**, 61, 3849) with appropriate aldehydes  $R^{3a}CHO$  provides the substituted alkyl pyrrolidine acids III of the invention. Treatment of 9 with diverse acid chlorides  $R^{3a}COCl$  in the presence of an appropriate base gives the corresponding amide pyrrolidine acids IV of the invention. Reaction of 9 with diverse isocyanate  $R^{3a}N=C=O$  provides the corresponding urea pyrrolidine acids V of the invention. Treatment of 9 with sulfonyl chlorides  $R^{3b}SO_2Cl$  furnishes the corresponding sulfonamide pyrrolidine acids VI of the invention. It is understood that these representative reactions of pyrrolidine 9 shown in Scheme 3 are also readily applied to the subsequent key secondary amine intermediates described below to give the corresponding functionalized analogs.

35 A synthesis of the homologated cis-substituted pyrrolidine acids VII of the invention is shown in Scheme 4. Treatment of aldehyde 3 with a substituted

alkynylmetal agent (generated from alkyne 12 in the presence of an appropriate base, e.g. n-butyllithium) furnishes the acetylenic alcohol adduct 13. Alcohol 13 is deoxygenated under standard methods (e.g. Et<sub>3</sub>SiH/  
5 CF<sub>3</sub>CO<sub>2</sub>H; e.g. *J. Org. Chem.*, **1990**, 55, 555) to give the alkynoate ester 14. The alkynoate ester 14 undergoes selective reduction by standard methods (e.g. H<sub>2</sub>/Lindlar's catalyst) to give the Z-alkenyl ester 15. This Z-alkenyl unsaturated ester 15 is then reacted with  
10 N-trimethylsilylmethyl N-methoxymethyl benzylamine 7 under standard literature conditions (*J. S. Carey, J. Org. Chem.*, **2001**, 66, 2526-2529) to give the corresponding N-benzyl pyrrolidine-ester 16. Deprotection of the N-benzyl group (hydrogenation) gives  
15 the key intermediate, pyrrolidine-ester 17. Reaction of pyrrolidine 17 with chloroformate 10 provides pyrrolidine-carbamate ester 18. Deprotection of the ester 18 then provides the cis-substituted pyrrolidine-carbamate acids VII of the invention.

20 An alternative synthesis of the key intermediate pyrrolidine ester 17 (for the special case where m = 0) is shown in Scheme 4A. Alcohol 13 is acetylated under standard conditions to give the acetylenic acetate 13A, which is then reacted with N-trimethylsilylmethyl N-  
25 methoxymethyl benzylamine 7 under standard literature conditions (e.g. *J. S. Carey, J. Org. Chem.*, **2001**, 66, 2526-2529) to give the N-benzyl dihydropyrrole 16A. Exhaustive hydrogenation/ hydrogenolysis of the benzylic acetate, the dihydropyrrole and the N-benzyl group then  
30 provides the intermediate pyrrolidine-ester 17.

Scheme 5 illustrates a synthetic route to the corresponding trans-substituted pyrrolidine-carbamate acids VIII of the invention. Aldehyde 3 undergoes a Wittig reaction with a phosphoranylidene ester 19 (e.g.  
35 "Preparation of Alkenes, A Practical Approach", J.M.J. Williams, Ed., Chapter 2, "The Wittig reaction and related methods", N.J. Lawrence, Oxford University Press,

1996) to give the predominantly E-alkenyl ester 20. The E-alkenyl ester 15 is then reacted with N-trimethylsilylmethyl N-methoxymethyl benzylamine 7 under standard literature conditions (J. S. Carey, *J. Org. Chem.* **2001**, 66, 2526-2529) to give the corresponding trans-substituted N-benzyl pyrrolidine-ester 21. Deprotection of the N-benzyl group (hydrogenation) gives the key intermediate, pyrrolidine-ester 22. Reaction of pyrrolidine 22 with chloroformate 10 provides pyrrolidine-carbamate ester 23. Deprotection of the ester 23 then provides the cis-substituted pyrrolidine-carbamate acids VIII of the invention.

Two alternative synthetic routes to the series of corresponding dihydropyrrole acids V of the invention are shown in Schemes 6-8. The first sequence (Schemes 6 and 7) begins with the acetylation of the hydroxy-acetylenic ester 13 to provide acetylenic acetate 24. Dipolar cycloaddition with the N-trimethylsilylmethyl N-methoxymethyl 4-methoxybenzylamine 25 (prepared as for compound 7 except using 4-methoxybenzylamine instead of benzylamine; J. S. Carey, *J. Org. Chem.* **2001**, 66, 2526-2529) furnishes the corresponding dihydropyrrole-ester 26. Deoxygenation of the allylic acetate 26 (e.g.  $(\text{Ph}_3\text{P})_2\text{PdCl}_2$ -mediated; Tsuji, J., et al, *Synthesis*, **1986**, 623-727) provide two isomeric alkene products: the  $\beta,\gamma$  unsaturated ester 27 and the dihydropyrrole ester 28. Deprotection of the 4-methoxybenzylamine (e.g. Yang, B. V., *Synlett*, **1993**, 195-196) subsequently furnish the corresponding key amine-ester intermediates 29 and 30 respectively. Reaction of dihydropyrroles 29 and 30 with chloroformate 10 provide the pyrrolidine-carbamate esters 31 and 32 respectively. Deprotection of the esters 31 and 32 then give the dihydropyrrole-carbamate acids IX and X of the invention.

An alternative synthetic sequence (for substrates where deoxygenation of 13 occurs readily to provide 14), involves the reaction of 14 with N-trimethylsilylmethyl

N-methoxymethyl 4-methoxybenzylamine 25 (as for Scheme 6) to furnish the corresponding dihydropyrrole-ester 30 directly (shown in Scheme 8). The rest of the synthetic route to provide carbamate acids X of the invention is  
5 then identical to that shown in Scheme 5.

The synthesis of dihydropyrrole carbamate-acid analogs XI is shown in Scheme 9. Alkylation of a halogenated phenol or hydroxy-heteroarene 32 with mesylate 4 in the presence of base provides the haloarene  
10 33. Coupling of 33 with silyl-alkyne 34 under standard Sonogashira conditions (ref. Organocopper Reagents, a Practical Approach, R. J. K. Taylor, Ed., Chapter 10, pp 217-236, Campbell, I. B., Oxford University Press, 1994) provides the arylalkyne 35. Removal of the silyl group  
15 (e.g. fluoride) followed by treatment with base and an appropriate chloroformate 36 (e.g. methyl chloroformate) furnishes the alkynoate ester 37. Dipolar cycloaddition with N-trimethylsilylmethyl N-methoxymethyl 4-methoxybenzylamine 25 furnishes the corresponding  
20 dihydropyrrole-ester 38. Deprotection of the N-methoxybenzyl amine group is achieved under standard conditions to furnish the dihydropyrrole ester 39. This intermediate then is reacted with electrophiles (e.g. chloroformate 10 in the presence of base) to provide  
25 carbamates 40. It is understood that reaction of 39 with other electrophiles (analogous to the examples in Scheme 3) can also be similarly achieved. Carbamate-esters 40 are then deprotected to furnish carbamate acids XI of the invention.

Knochel et al., *Synthesis*, 2002, 565-569, or magnesium/anthracene, ref.) provides the corresponding organomagnesium reagent 71, which is reacted with an appropriate pyridine ester 72 in the presence of a suitable chloroformate 10 and a copper (I) salt (e.g.  $CuBr \cdot SMe_2$ ) to give the corresponding dihydropyridine carbamate ester 73 (e.g. ref. D. J. Wallace et al., *Synthesis*, 2001, 1784-1789). Reduction of the dihydropyridine esters 73 (e.g. hydrogenation) furnishes piperidine carbamate ester 74, which is then deprotected to give the phenol 75. of base (standard aldol reaction) followed by deoxygenation to furnish the 2-alkyl piperidone 79. Treatment of 79 with triflic anhydride in the presence of base (e.g.  $i\text{Pr}_2\text{NMg}$ ) under thermodynamic conditions  
5 furnishes enol triflate 80. Palladium-mediated carbonylation under standard literature conditions (e.g. S. K. Thompson et al., *J. Org. Chem.*, **1990**, 55, 3004) with carbon monoxide in the presence of an alcohol (preferably methanol) furnishes the tetrahydropyridine

25 The synthesis of piperazine acids XXI (where in Formula I  $q = 1$ , Z is a bond,  $p = 2$  and E is nitrogen) is shown in Schemes 20A and 20B. In Scheme 20A reductive amination of aldehyde 78 with a readily available monoprotected piperazine ester 87 furnishes the alkylated  
30 piperazine ester 88. Deprotection of 88 provides the phenol 89, which is alkylated with mesylate 4 in the presence of base to furnish the alkylated piperazine ester 90. Selective deprotection of the amine followed by reaction with chloroformates 10 provides piperazine  
35 carbamate-esters 91. Deprotection of carbamate-esters 91 furnishes piperazine carbamate-acids XXI of the invention.

Alternatively, piperazine carbamate-acids XXI can also be synthesized according to the synthetic sequences shown in Scheme 20B. Reductive amination of the monoprotected piperazine ester 87 with aldehyde 3  
5 directly provides the key intermediate alkylated piperazine ester 90. As described for Scheme 20A, a 3-step sequence involving: 1) selective deprotection of the amine functionality of 90; 2) reaction with chloroformates 10 and 3) deprotection of the acid,  
10 furnishes piperazine carbamate-acids XXI of the invention. In addition, complete deprotection of piperazine-ester 90 provides piperazine acid 92, which is then reacted with chloroformates 10 to furnish piperazine carbamate-acids XXI of the invention.

15 The synthesis of azetidine-acids XXII (in Formula I where Z is a bond, q = 0, p = 1 and E = CH) is shown in Scheme 21. The hydroxyaryl ester 93 is alkylated with mesylate 4 under basic conditions, then deprotected to provide the acid 94. Acid 94 is converted to the  
20 corresponding acid chloride under standard conditions (oxalyl chloride in the presence of a catalytic amount of dimethyl formamide), then is treated with a bis-imine such as 95 under Staudinger conditions (reference: R. M. Adlington et. al., *J. Med. Chem.*, **2001**, 44, 1491) to  
25 furnish the key intermediate  $\beta$ -lactam aldehyde 96. Protection of the aldehyde 96 (e.g. as the dimethyl acetal) followed by reduction of the resulting  $\beta$ -lactam acetal (e.g.  $\text{AlH}_2\text{Cl}$ , reference: B. Alcaide et. al. *J. Org. Chem.*, **1999**, 64, 9596) furnishes the corresponding  
30 azetidine acetal 97. Deprotection of the azetidine under standard conditions (e.g. ceric ammonium nitrate) followed by reaction with chloroformates 10 furnishes the corresponding azetidine-carbamates. Deprotection of the aldehyde under standard conditions (aqueous acid)  
35 followed by a standard oxidation of the aldehyde (e.g.  $\text{NaClO}_2/\text{H}_2\text{NSO}_3\text{H}$ ; reference: B. O. Lindgren et. al., *Acta Chem. Scand.*, **1973**, 27, 888 or E. Dalcanale et. al., *J.*

*Org. Chem.*, **1986**, 51, 567) provides the azetidine carbamate-acids XXII of the invention.

Direct oxidation of the intermediate  $\beta$ -lactam aldehyde 96 (e.g. the Lindgren oxidation) furnishes the  
5 azetidinone acids XXIII of the invention.

A general method for synthesis of the cis-disubstituted  $\beta$ -lactam acids XXIV and the corresponding trans-disubstituted azetidinone-acids XXV is depicted in Scheme 22. A suitably protected carboxylic acid 98  
10 (e.g., PG<sub>1</sub> = benzyl) is converted to the acid chloride 99, which upon treatment with a suitably substituted bis-imine (e.g. 95) undergoes a Staudinger reaction (reference: R. M. Adlington et. al., *J. Med. Chem.*, **2001**, 44, 1491) to furnish the key intermediate  $\beta$ -lactam  
15 aldehyde 100. Oxidation of aldehyde 100 to the corresponding carboxylic acid (e.g. Lindgren oxidation) followed by protection (esterification) provides the  $\beta$ -lactam ester 101. Removal of the N-4-methoxyphenyl group provides the corresponding deprotected  $\beta$ -lactam ester  
20 102, which then is reacted with a variety of diverse aryl boronic acids 103

, where R<sup>8</sup> is H, alkyl, alkoxy, halogen, amino or substituted amino, and X<sub>1</sub> is CH or N)

25 under copper-mediated catalysis (Chan, D. M. T. et al. *Tetrahedron Lett.* **1998**, 39, 2933; Evans, D. A. et al. *Tetrahedron Lett.* **1998**, 39, 2937) to provide the corresponding N-aryl esters 104. Deprotection of the phenol followed by alkylation of the phenol with mesylate  
30 4 under basic conditions provides the alkylated  $\beta$ -lactam ester 105. Appropriate deprotection of the  $\beta$ -lactam ester 105 gives a mixture of the cis-disubstituted azetidinone acids XXIV and the epimerized trans-disubstituted azetidinone acids XXV of the invention.

35 An alternative synthesis of azetidinone acids XXIII is illustrated in Scheme 23. Deprotection of the phenol

moiety of azetidinone-ester 101 provides the phenol 102, which undergoes base-mediated alkylation using mesylate 4 to give the alkylated phenol azetidinone-ester 107. Removal of the final protecting group provides the  
5 azetidinone acids XXIII. Yet another route to acids XXIII is shown in Scheme 24). The  $\beta$ -lactam aldehyde intermediate 100 is reduced by standard methods (e.g.  $\text{NaBH}_4$ ), after which the phenol is deprotected to give the phenol-azetidinone alcohol 108. Alkylation of 108 with  
10 mesylate 4 provides the alkylated phenol azetidinone alcohol 109, which is then oxidized under standard literature conditions (e.g. Jones reagent) to give the azetidinone acids XXIII of the invention.

It should be noted that in Schemes 21-24, a number  
15 of the racemic intermediates (e.g. 102 and 107) as well as the final product azetidinone-acids XXIII-XXV, are amenable to separation into their individual enantiomers by chiral preparative HPLC.

An approach to the direct asymmetric synthesis of  
20 the key chiral azetidinone intermediate 112 is shown in Scheme 25. A chiral ligand-mediated coupling of the acid chloride 99 with suitably protected carboxy-tosyl imines such as 110 (Ref: Taggi, A. E. et al. *J. Am. Chem. Soc.* **2002**, 124, 6626) affords the chiral cis-disubstituted  $\beta$ -  
25 lactam 111 with high enantioselectivity. N-deprotection of the tosylated  $\beta$ -lactam 111 furnishes the corresponding  $\beta$ -lactam, which then is reacted with diverse aryl boronic acids 103 under copper-mediated catalysis (Chan, D. M. T. et al. *Tetrahedron Lett.* **1998**, 39, 2933; Evans, D. A. et al. *Tetrahedron Lett.* **1998**, 39, 2937) to provide  
30 the corresponding N-aryl esters 112. The chiral intermediate 112 can be processed as before to furnish chiral azetidinone-acids XXIII-XXV of the invention as described in Schemes 21-24 and 26.

35 An alternative approach to N-carbamate azetidine acids XXII is shown in Scheme 26. Reduction of the azetidinone-aldehyde intermediate 100 (e.g. with

chloroalane) provides the N-aryl azetidine alcohol 113. Deprotection of the N-aryl azetidine to the corresponding azetidine followed by reaction with appropriate chloroformates 10 affords the N-carbamate azetidine alcohols 114. Oxidation of azetidine alcohol 114 to the acid (e.g. Jones reagent) followed by protection of the acid (esterification) provides the azetidine carbamate ester 115. Deprotection of 115 gives the free phenol 116, which undergoes base-mediated reaction with mesylate 4 to give the alkylated azetidine carbamate ester 117. Finally, deprotection of 117 provides the desired carbamate acids XXII of the invention.

The synthesis of the corresponding N-Aryl azetidine acids XXVI is shown in Scheme 27. Reduction of either racemic N-aryl azetidinone ester 104 or chiral N-aryl azetidinone ester 112 (e.g. chloroalane) provides the corresponding azetidine-alcohol 118. Deprotection of the phenol of 118 followed by alkylation with mesylate 4 and finally oxidation (e.g. Jones reagent) provides the N-aryl azetidine acids XXVI of the invention.

The azetidinone acids XXVII and the pyrrolidinone acids XXVIII may be obtained following the general procedure shown in Scheme 28 (literature precedent: Wee, A. G. H.; Liu, B-S.; Zhang, L. *J. Org. Chem.*, **1992**, *57*(16), 4404; also Wee, A. G. H.; Liu, B. *Tetrahedron Lett.* **1996**, *37*(2), 145-148). The intermediate aniline 121 can be synthesized either by: a) reductive amination (e.g. with NaBH(OAc)<sub>3</sub>) of aldehyde 3 with an appropriate aniline or b) an aniline carbamate 119 can be alkylated with an alkyl halide 120 in the presence of a base (e.g. NaH) and then the carbamate can be removed with a nucleophilic base (e.g. KOH). Acylation of aniline 121 with the malonyl acid chloride 122 in the presence of base (e.g. Et<sub>3</sub>N or pyridine or DMAP) provides the malonyl amide 123. Treatment of the  $\beta$ -ketoamide 123 with an appropriate diazotization agent (e.g. methanesulfonyl azide) in the presence of base (e.g. DBU) provides the

diazoester 124. Rhodium-mediated intramolecular cyclization (by C-H insertion) of diazo-ester 124 provides a mixture of the corresponding azetidinone and pyrrolidinone esters. Deprotection of these esters  
5 provides the azetidinone acids XXVII of the invention as a mixture of diastereomers (cis and trans) and the pyrrolidinone acids XXVIII as a mixture of diastereomers (cis and trans) of the invention. The ratio of products XXVII and XXVIII can be controlled by an appropriate  
10 choice of the substituent on the aniline moiety.

An alternative synthesis of piperidine carbamate-acids XIX and piperidine N-aryl acids XXIX is shown in Scheme 29. Treatment of an appropriately protected aryl substituted halide 70 with activated zinc provides the  
15 aryl zinc reagent 125 (ref: Rieke, R., et al., *J. Org. Chem.*, **1991**, 56, 1445-1453). An appropriately protected piperidone ester 126 is converted to the corresponding enol nonaflate 127 under standard literature conditions (ref: Bellina, F. et al, *Tetrahedron*, **1999**, 55, 2103-  
20 2112). Treatment of enol nonaflate 127 with the aryl zinc reagent 125 in the presence of a palladium catalyst (ref: Bellina, F. et al, *Tetrahedron*, **1999**, 55, 2103-2112) provides the coupled  $\alpha,\beta$ -unsaturated ester 81. The phenol of 81 is deprotected and alkylated with mesylate 4  
25 (as for Scheme 18) to provide the piperidine ester 83. Hydrogenation and N-deprotection of 83 furnishes the key piperidine ester 128, which is then converted according to the sequence in Scheme 19 to the piperidine carbamate acids XX of the invention.

30 As shown in Scheme 30, the intermediate piperidine ester 128 can also be reacted with aryl or heteroaryl halides in the presence of a palladium catalyst (e.g. method of Buchwald et. al., *J. Am. Chem. Soc.*, **2001**, 123, 7727) to furnish the N-aryl or N-heteroaryl piperidine  
35 acids XXIX of the invention. Alternatively, intermediate piperidine ester 128 can also be reacted directly with electron-deficient heteroaryl halides in the presence of

base to give N-heteroaryl piperidine acids XXX of the invention.

Scheme 31 shows the synthesis of the  $\alpha,\beta$ -unsaturated piperidine acids. The phenol moiety of the N-protected piperidine ester 81 is deprotected and alkylated with mesylate 4 to provide alkylated phenol 83, which is then deprotected to furnish the key free piperidine intermediate 129. Intermediate 129 is treated with an appropriate chloroformate 10 and deprotected to give piperidine carbamate-acids XIX of the invention (as for Scheme 18). Alternatively, piperidine 129 can be treated with an aryl halide or a heteroaryl halide in the presence of a palladium catalyst (e.g. method of Buchwald et. al., *J. Am. Chem. Soc.*, **2001**, 123, 7727) followed by deprotection of the acid to furnish the N-aryl or N-heteroaryl piperidine acids XXXI and XXXII of the invention. In addition, electron-deficient heteroaryl halides can be directly reacted with piperidine intermediate 129 in the presence of base followed by deprotection of the acid to provide N-heteroaryl piperidine acids XXXII of the invention.

The synthesis of  $\beta,\gamma$ -unsaturated piperidine acids XXXIII-XXXV of the invention is shown in Scheme 32. The piperidine  $\alpha,\beta$ -unsaturated ester intermediate 129 is reacted with a chloroformate 10 to provide the corresponding piperidine carbamate  $\alpha,\beta$ -unsaturated ester 130. Base-mediated deprotection of the acid (ester hydrolysis) furnished the piperidine carbamate  $\beta,\gamma$ -unsaturated acids XXXIII of the invention. Similarly, reaction of piperidine 129 with aryl halides in the presence of a palladium catalyst (as for Scheme 31) provided the corresponding N-aryl piperidine  $\alpha,\beta$ -unsaturated ester, which upon base hydrolysis furnished the N-aryl piperidine  $\beta,\gamma$ -unsaturated acids XXXIV of the invention. Reaction of piperidine 129 with  $\pi$ -deficient heteroaryl halides in the presence of base provided the corresponding N-heteroaryl piperidine  $\alpha,\beta$ -unsaturated

ester, which upon base hydrolysis furnished the N-heteroaryl piperidine  $\beta,\gamma$ -unsaturated acids XXXV of the invention.

5 The preparation of pyrrolidinone acids XXXVI of the invention is shown in Scheme 33. A suitably protected pyrrolidinone ester 130 is deprotonated with an appropriate base (e.g. lithium diisopropylamide) and alkylated with a protected aryl halide 70 to furnish the alkylated pyrrolidinone ester 131. The phenol of  
10 pyrrolidinone ester 131 is deprotected and alkylated with mesylate 4 to provide pyrrolidinone ester 132, which is N-deprotected to give the key pyrrolidinone ester intermediate 133. Palladium-mediated arylation with an appropriate arylboronic acid followed by deprotection of  
15 the acid provides pyrrolidinone acids XXXVI of the invention.

The preparation of pyrrolidinone acids XXXVII and XXXIX of the invention is shown in Scheme 34. The appropriately protected pyrrolidinone ester 134 is  
20 deprotonated with an appropriate base (e.g. lithium diisopropylamide) and alkylated with halide 70 to provide the alkylated lactam ester 135 (ref: Saksena, A. K., et al., Patent PCT WO0208256; August, R. A., *J. Chem. Soc. Perkin 1*, **1996**, 507-514). Deprotection of the phenol  
25 moiety of 135 followed by alkylation with mesylate 4 in the presence of base gives the alkylated phenol lactam ester 136. N-Deprotection of the lactam provides the key intermediate lactam 137, which is reacted with appropriate aryl boronic acids to provide the  
30 corresponding N-aryl lactam ester followed by deprotection of the acid to provide N-aryl pyrrolidinone acids XXXVII of the invention. Alternatively, after lactam 137 is reacted with aryl boronic acids to provide the corresponding N-aryl lactam ester, the lactam is  
35 reduced (e.g. 2 step sequence: a) LiBHET<sub>3</sub>, b) Et<sub>3</sub>SiH/BF<sub>3</sub>OEt<sub>2</sub>; ref: Ezquerra, J., *J. Org. Chem.*, **1995**, 60, 2925-2930) to the corresponding pyrrolidine ester,

which is then deprotected to give the N-aryl pyrrolidine acids XXXIX of the invention.

- The preparation of N-substituted pyrrolidine acids XXXVIII-XXXX of the invention is shown in Scheme 35. The
- 5 lactam ester 136 is reduced (e.g. 2 step sequence: a)  $\text{LiBHET}_4$ , b)  $\text{Et}_3\text{SiH}/\text{BF}_3\text{OEt}_2$ ) to the corresponding pyrrolidine ester, which then undergoes N-deprotection to provide the key intermediate pyrrolidine ester 139. Reaction of pyrrolidine 139 with chloroformates 10
- 10 provide the carbamate pyrrolidine ester 140, which is then deprotected to furnish carbamate pyrrolidine acids XXXVIII of the invention. Reaction of pyrrolidine 139 with aryl halides in the presence of a palladium catalyst (as for Scheme 31) provided the corresponding N-aryl
- 15 pyrrolidine ester, which upon deprotection of the acid furnished the N-aryl pyrrolidine acids XXXIX of the invention. Reaction of pyrrolidine 139 with  $\pi$ -deficient heteroaryl halides in the presence of base or under palladium catalysis provided the corresponding N-
- 20 heteroaryl pyrrolidine ester, which upon deprotection of the acid furnished the N-heteroaryl pyrrolidine acids XXXX of the invention.

- The synthesis of pyrrolidine acids XLI-XLIII of the invention is shown in Scheme 36. The benzamide-protected
- 25  $\alpha$ -amino ester 141 is alkylated with mesylate 4 in the presence of base to furnish the alkylated phenol 142. Reduction of the benzamide and ester (e.g.  $\text{LiAlH}_4$  or  $\text{LiBH}_4$ ) followed by Michael reaction of the resultant amine with acrylonitrile in the presence of base to give the  $\beta$ -
- 30 amino-nitrile 143. Chlorination of the alcohol 143 (e.g. with  $\text{SOCl}_2$ ) followed by base (e.g.  $\text{NaN}(\text{TMS})_2$ )-mediated intramolecular cyclization provides the cyano-pyrrolidine 144. This sequence is preceded in the literature (R. Achini, *Helv. Chim. Acta*, **1981**, 64, 2203-2218). Acid-
- 35 mediated hydrolysis (e.g.  $\text{H}_2\text{SO}_4$ ) of the nitrile in the presence of an appropriate alcohol provides the corresponding pyrrolidine ester, which is debenzylated

(e.g. hydrogenation) to provide the key pyrrolidine ester intermediate 145. Reaction of pyrrolidine 145 with chloroformates 10 provide the corresponding carbamate pyrrolidine ester, which is then deprotected to furnish  
5 carbamate pyrrolidine acids XLI of the invention. Reaction of pyrrolidine 145 with aryl halides in the presence of a palladium catalyst (as for Scheme 31) provided the corresponding N-aryl pyrrolidine ester, which upon deprotection of the acid furnished the N-aryl  
10 pyrrolidine acids XLII of the invention. Reaction of pyrrolidine 145 with  $\pi$ -deficient heteroaryl halides in the presence of base or under palladium catalysis provided the corresponding N-heteroaryl pyrrolidine ester, which upon deprotection of the acid furnished the  
15 N-heteroaryl pyrrolidine acids XLIII of the invention.

An asymmetric synthesis of pyrrolidine acids XLIV and XLV is shown in Scheme 37. The maleimide 146 is reacted with N-trimethylsilylmethyl N-methoxymethyl benzylamine 7 under standard literature conditions (e.g.  
20 J. S. Carey, *J. Org. Chem.*, **2001**, 66, 2526-2529) to give the corresponding N-benzyl pyrrolidine-ester 147. The imide 147 is then reacted with an appropriately protected aryl Grignard reagent 148; the intermediate hydroxy lactam is reduced (e.g. NaBH<sub>4</sub>) and thermally-induced  
25 intramolecular cyclization provides the lactone 149. Deprotection of the phenol moiety of lactone 149 followed by base-mediated alkylation of the phenol with mesylate 4 provides the alkoxyphenol lactone 150. Deprotection (hydrogenation) of the N-benzyl group with concomitant  
30 hydrogenolysis of the benzylic lactone C-O bond provides the pyrrolidine acid 151, which is reprotected with an appropriate alcohol to furnish the key intermediate pyrrolidine ester 152. Reaction of 152 with an appropriate chloroformate 10 and acid deprotection (as  
35 for Scheme 4) provides chiral pyrrolidine carbamate acids XLIV of the invention. Reaction of 152 with appropriate aryl halides or heteroaryl halides followed by acid

deprotection (as for Scheme 35) provides chiral N-aryl pyrrolidine acids XLV and chiral N-heteroaryl pyrrolidine acids XLVI of the invention respectively.

5 The synthesis of hydantoin acids XLVII of the invention is shown in Scheme 38. Reductive amination (e.g.  $\text{NaBH}(\text{OAc})_3$  or  $\text{NaBH}_3\text{CN}$ ) of aryl aldehyde 3 with an aspartate derivative 153 gives the amino-diester 154. Reaction of amino-diester 154 with appropriate aryl isocyanates 155 with heat results in the formation of  
10 hydantoin ester 156. Deprotection of hydantoin ester 156 provides hydantoin acids XLVII of the invention. It should be noted that the use of L- or S-aspartate diesters provides the individual enantiomers of hydantoin acids XLVII of the invention.

15 The synthesis of piperidine acids XLVIII-L of the invention is shown in Scheme 39. Reaction of the  $\alpha$ -carboalkoxy piperidone 157 with nonafllyl fluoride in the presence of base provides the enol nonaflate 158. Palladium mediated coupling of enol nonaflate 158 with  
20 the organozinc reagent 125 (as previously described for Scheme 29; ref: (Bellina, F. et al, *Tetrahedron*, **1999**, 55, 2103-2112)) provides the coupled  $\alpha,\beta$ -unsaturated ester 159. The phenol of 159 is deprotected and alkylated with mesylate 4 (as for Scheme 18) to provide  
25 the piperidine ester 160. N-deprotection of 160 furnishes the key piperidine ester 161, which is then converted according to the sequence in Scheme 37 to the piperidine carbamate acids XLVIII of the invention, the N-aryl piperidine acids XLIX of the invention and N-  
30 heteroaryl piperidine acids L of the invention.

The preparation of piperidine acids L1-LIII of the invention is shown in Scheme 40. Treatment of  $\alpha$ -carboalkoxy piperidone 157 with triflic anhydride in the presence of base provides enol triflate 162. Palladium-  
35 mediated coupling of enol triflate 162 to an appropriately substituted aryl boronic acid 163 (ref: Wustrow, D.J. and Wise, L.D., *Synthesis*, **1991**, 993-995)

provides the coupled piperidine  $\alpha,\beta$  unsaturated ester 164. Deprotection of the phenol moiety of 164 followed by alkylation with mesylate 4 provides the alkoxy phenol piperidine ester 165, which is then N-deprotected to  
5 furnish the free piperidine ester 166.  
Piperidine ester 166 is then converted according to the sequences shown in Scheme 37 to the piperidine carbamate acids LI of the invention, the N-aryl piperidine acids LII of the invention and N-heteroaryl piperidine acids  
10 LIII of the invention.

Scheme 41 illustrates the synthesis of piperidine acids LIV-LVI of the invention. Reduction (hydrogenation) of the  $\alpha,\beta$  unsaturated ester 166 provides the corresponding piperidine ester 167. Piperidine ester  
15 167 is then converted according to the sequences shown in Scheme 37 to the piperidine carbamate acids LIV of the invention, the N-aryl piperidine acids LV of the invention and N-heteroaryl piperidine acids LVI of the invention.

30 embodiments of the invention.

Example 1

5           A.

A solution of benzylamine (8.9 mL; 82 mmol) and  
chloromethyltrimethylsilane (5.0 g; 41 mmol) in MeCN (100  
10 mL) was heated at reflux for 16 h. The reaction was  
cooled to RT, filtered, and the filtrate was concentrated  
in vacuo to a volume of ~30 mL. H<sub>2</sub>O (100 mL) was added  
and the mixture was extracted with hexane (2 x 20 mL).  
The combined organic extracts were washed with H<sub>2</sub>O (3 x  
15 20 mL), dried (MgSO<sub>4</sub>) and concentrated in vacuo to give  
Part A compound (7.70 g; 49%) as an oil.

B.

20

To a 0°C solution of formaldehyde (4.6 g of a 37%  
aqueous solution; 55.7 mmol) and 1N aqueous NaOH (5  
drops) was added dropwise Part A compound (7.70 g; 39.8  
mmol). After the mixture had been stirred at 0°C for 10  
25 min, MeOH (4 mL) was added, followed by K<sub>2</sub>CO<sub>3</sub> (4.0 g).  
The mixture was allowed to warm to RT and stirred at RT  
for 1 h. The organic phase was separated, more K<sub>2</sub>CO<sub>3</sub> (2.0  
g) was added, and the reaction was stirred at RT for 12  
h. Et<sub>2</sub>O (20 mL) was then added to the mixture, which was  
30 filtered and the filtrate was concentrated in vacuo. The

residual oil was distilled at reduced pressure (0.5 mm Hg; 80°C) to give Part B compound (4.67 g; 49%) as an oil.

5 C.

A mixture of 3-hydroxy phenylethanol (4.0 mg; 28 mmol), the mesylate Example 23 Part A compound (8.0 g; 28 mmol)

and K<sub>2</sub>CO<sub>3</sub> (15.0 g; 110 mmol) in MeCN (150 mL) was stirred at 90°C for 5 h. At this point LC/MS showed that the reaction was complete. The reaction was cooled to RT, solids were filtered off, and the filtrate was diluted with EtOAc (100 mL). The solution was successively washed with aqueous 1 M HCl (10 mL), 1 M NaOH (10 mL) and H<sub>2</sub>O (50 mL), dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated in vacuo. The residue was chromatographed (SiO<sub>2</sub>; 2:1 hex:EtOAc) to give Part C compound (8.7 g; 96%) as an oil.

D.

To a solution of Part C compound (4.0 g; 12.3 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (50 mL) were added Florisil™ (8.0 g), pyridinium chlorochromate (4.0 g; 19 mmol) and the reaction was stirred at RT for 3 h. The mixture was then diluted with anhydrous Et<sub>2</sub>O (200 mL) and filtered. The chromium solid wastes were washed with additional Et<sub>2</sub>O (3 x 100 mL); the combined organic filtrates were

methanesulfonyl chloride (12.40 g, 0.108 mol) in one portion (exothermic reaction). After recooling to -5°C, Et<sub>3</sub>N (11.1 g, 0.110 mol) was added slowly over 30 min (internal temperature <3°C). The reaction was allowed to  
5 warm to RT and stirred for 1 h (reaction monitored by analytical HPLC), at which point starting material had been consumed. The reaction was washed with aqueous HCl (2 x 50 mL of a 3N solution). The combined aqueous layers were extracted with CH<sub>2</sub>Cl<sub>2</sub> (50 mL). The combined  
10 organic extracts were successively washed with satd. aqueous NaHCO<sub>3</sub> and brine (50 mL each), dried (Na<sub>2</sub>SO<sub>4</sub>), and concentrated to ~30 mL volume. Methyl tert-butyl ether (120 mL) was added and the mixture was stirred; a white solid was formed. The mixture was cooled to -20°C for  
15 complete crystallization. The product was filtered and vacuum-dried to give Part A compound (23.3 g, 85%) as a white solid. The mother liquor was concentrated in vacuo and recrystallized from methyl tert butyl ether/heptane to give a second crop of Part A compound (3.3 g, 12%;
